Continuous deployment settings

Set up continuous deployment to easily deploy code from your GitHub repository via GitHub Actions. Learn more

Continuous deployment ◉ Disable ○ Enable

GitHub settings

Set up GitHub Actions to push content to your app whenever there are code changes made to your repository. Note: Your GitHub account must have write access to the selected repository in order to add a workflow file which manages deployments to your app.

GitHub account: Authorize

Organization: Select organization

Repository: Select repository

Branch: Select branch

Workflow configuration

Click the button below to preview what the GitHub Actions workflow file will look like before setting up continuous deployment.

Complete the Basics tab and the form above to preview the GitHub Actions workflow file.

Preview file

Authentication settings

Choose if you would like to allow basic authentication to deploy code to your app. Learn more

Basic authentication ◉ Disable ○ Enable

Home > App Services

Create Web App

Basics | Database | Deployment | **Networking** | Monitor + secure | Tags | Review + create

Web Apps can be provisioned with the inbound address being public to the internet or isolated to an Azure virtual network. Web Apps can also be provisioned with outbound traffic able to reach endpoints in a virtual network, be governed by network security groups or affected by virtual network routes. By default, your app is open to the internet ged after the app is provisioned. Learn more

Enable public access * (On) (Off)

Enable virtual network integration * (On) (Off)

Summary

Web App
by Microsoft

Basic (B1) sku
Estimated price - 1093.18 INR/Month

Basic authentication for this app is currently disabled and may impact deployments. Click to learn more.

Details

Subscription	23d99a1f-8507-41a7-b40b-64402a51e95e
Resource Group	rdbg
Name	E-commSemanticSearch
Secure unique default hostname	Enabled
Publish	Code
Runtime stack	Python 3.11

App Service Plan (New)

Name	ASP-rdbg-9249
Operating System	Linux
Region	Canada Central
SKU	Basic
Size	Small
ACU	100 total ACU
Memory	1.75 GB memory

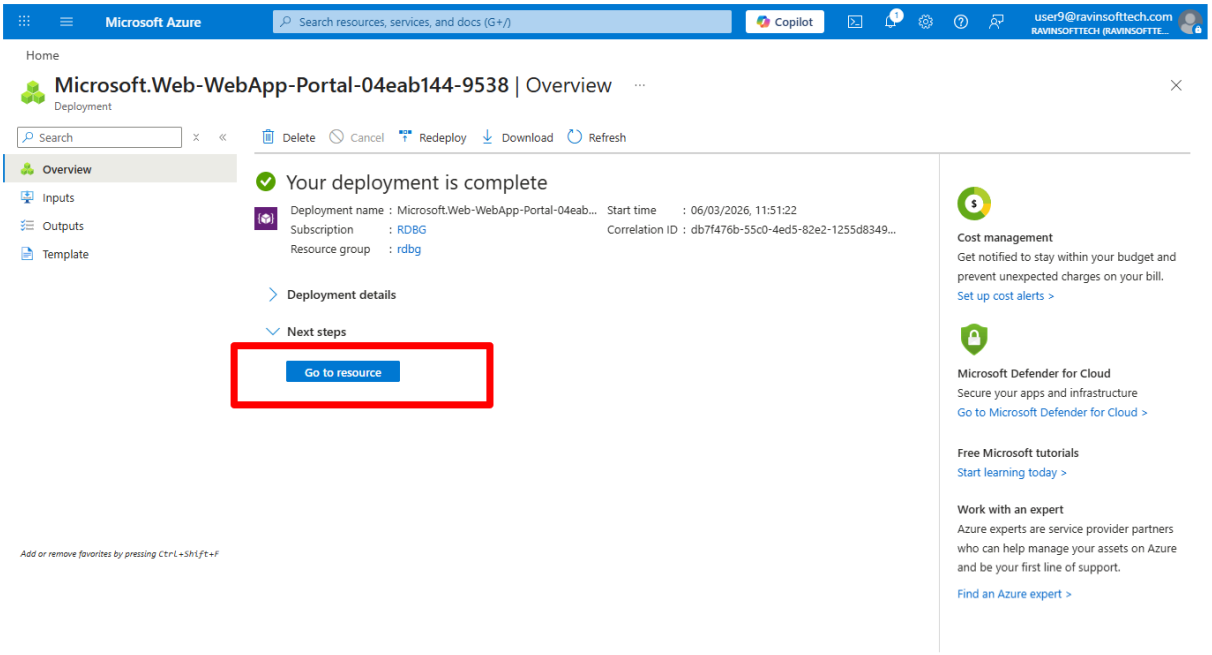
Monitor + secure

Application Insights	Not enabled

Deployment

Basic authentication	Disabled
Continuous deployment	Not enabled / Set up after app creation

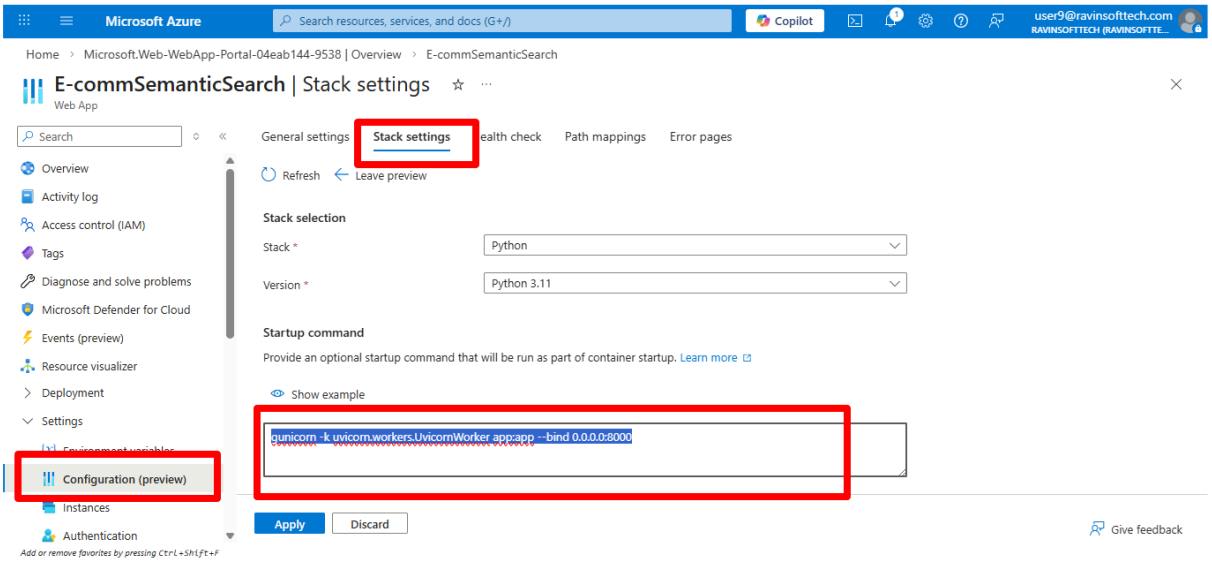
Create | < Previous | Next > | Download a template for automation



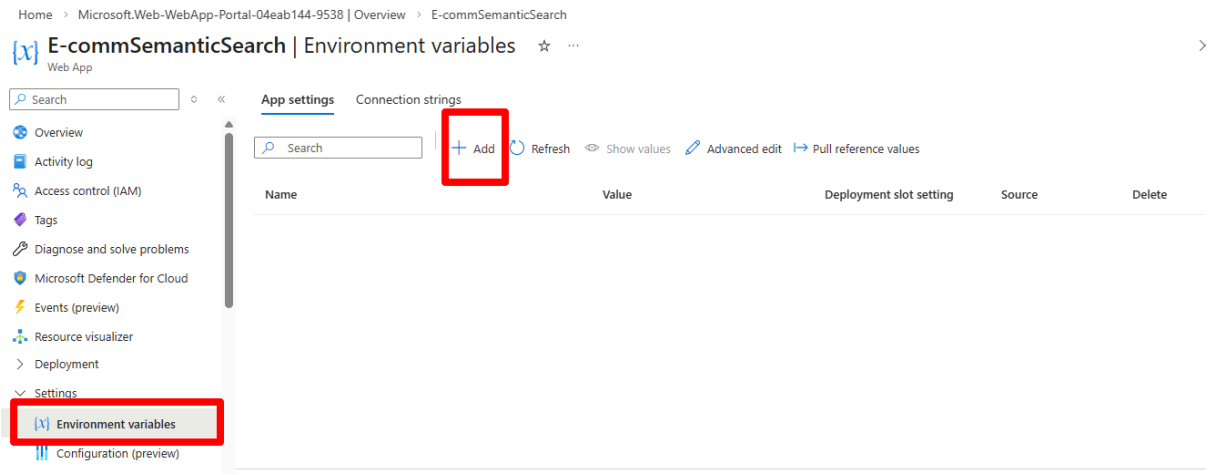
Goto WebApp settings-> configuration ->stack settings->paste startup command.

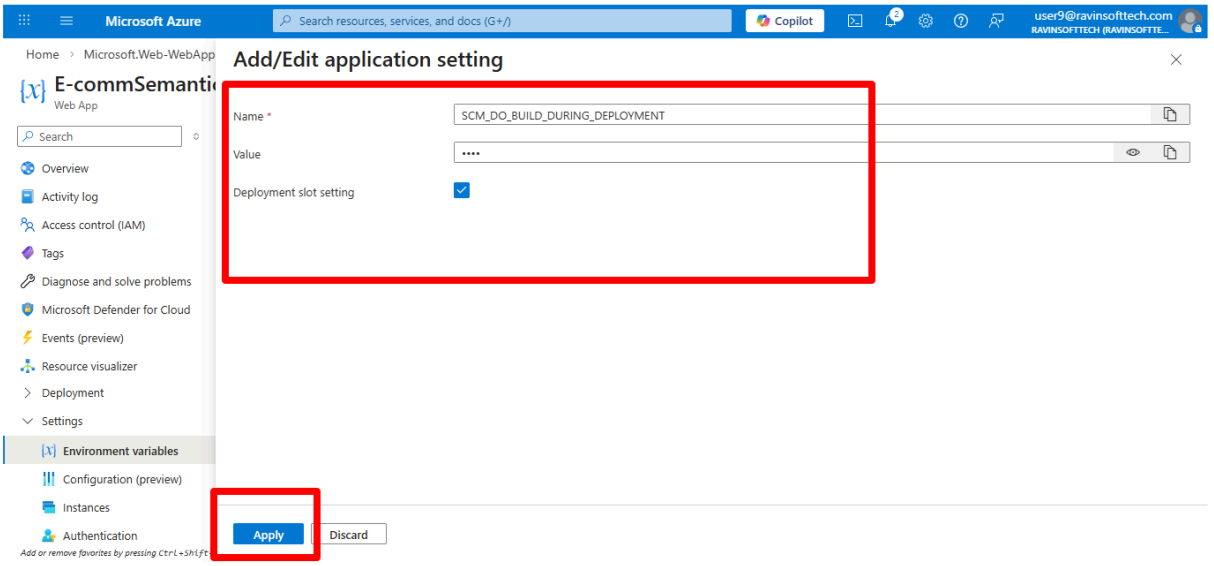
gunicorn -k uvicorn.workers.UvicornWorker app:app --bind 0.0.0.0:8000

Apply the changes .



- And goto Environment Variables->App settings->Add SCM_DO_BUILD_DURING_DEPLOYMENT = true





Goto Devops organization, you have given access to Organization.

New pipeline
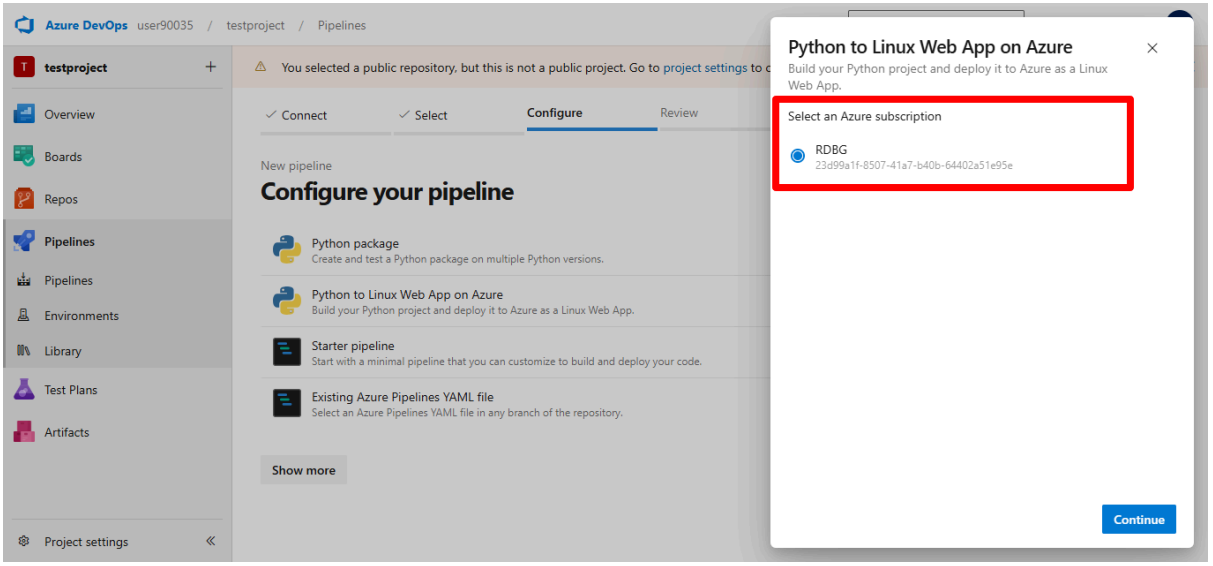
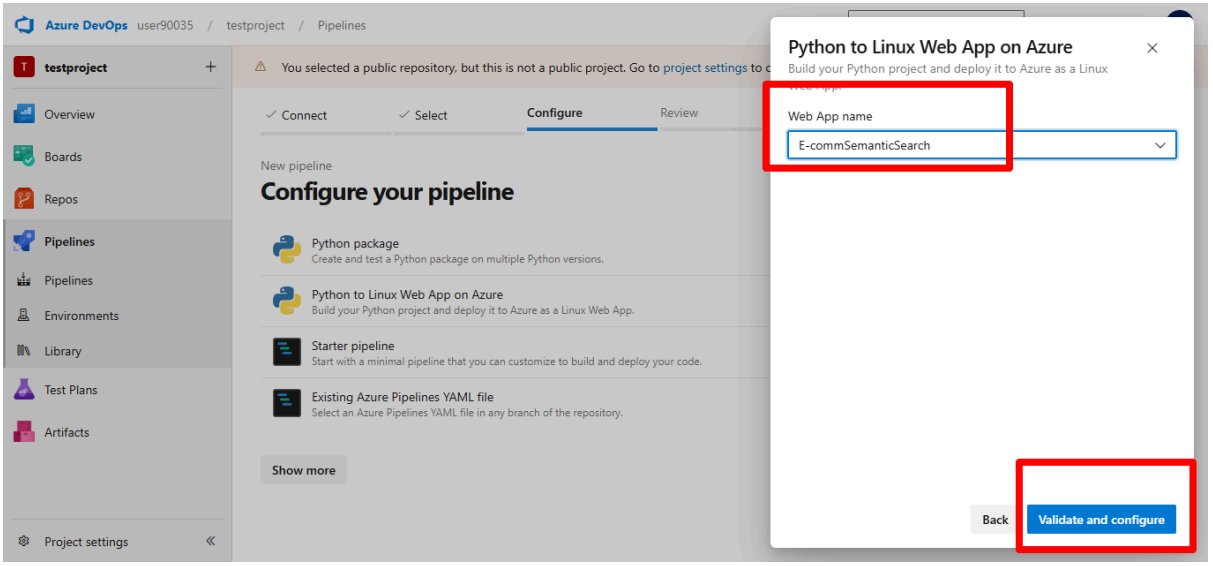
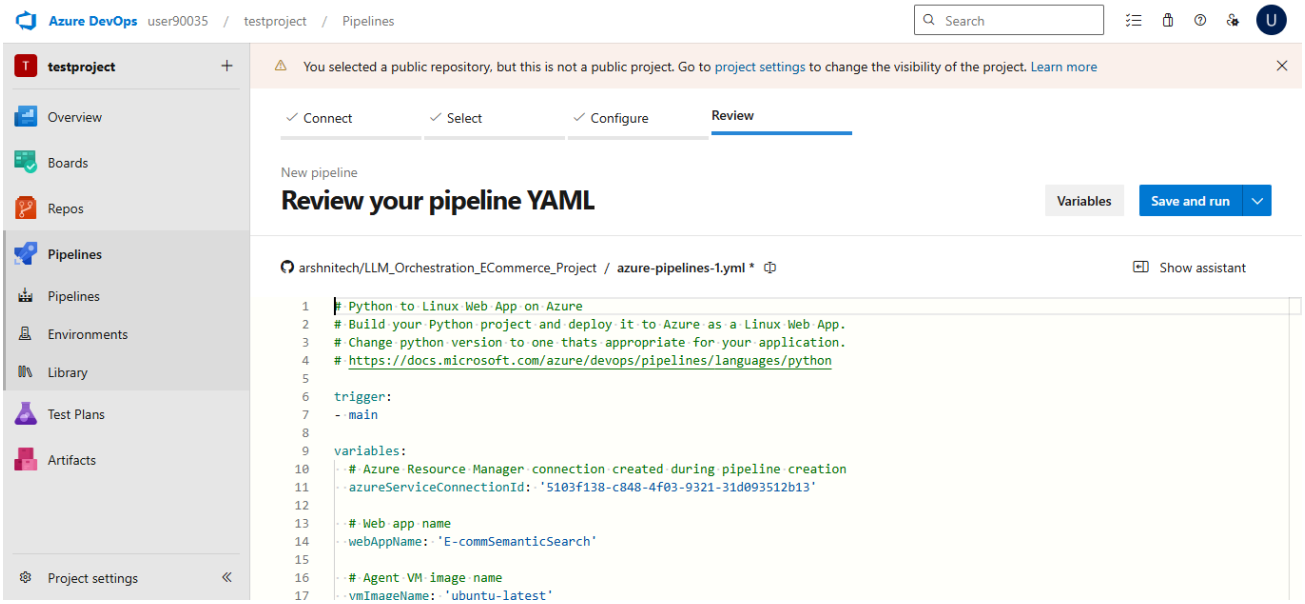
Configure your pipeline
Python package
Create and test a Python package on multiple Python versions.
Python to Linux Web App on Azure
Build your Python project and deploy it to Azure as a Linux Web App.
Starter pipeline
Start with a minimal pipeline that you can customize to build and deploy your code.
Existing Azure Pipelines YAML file
Select an Azure Pipelines YAML file in any branch of the repository.
Show more





Configure YAML file with

1. Service connection id
2. App service name
3. Agent name



Replace the above azure-pipelines.yml (YAML) file with below and change service connection, App service and Agent details.

```
trigger:
- main

variables:
  azureServiceConnectionId: 'a08b4ecc-aa03-4056-8d11-66deb4c26b54'
  webAppName: 'E-commSemanticSearch'
  pythonVersion: '3.11'

stages:

- stage: Build
  displayName: Build Stage
  jobs:
  - job: BuildJob
    pool:
      name: selfhosted-pool   #  Self-hosted pool
```

```
    steps:
    - script: |
        echo Python Version
        python --version
      displayName: Check Python

    - script: |
        python -m pip install --upgrade pip
        pip install -r requirements.txt
      displayName: Install Dependencies

    - task: ArchiveFiles@2
      inputs:
        rootFolderOrFile: '.'
        includeRootFolder: false
        archiveType: zip
        archiveFile: $(Build.ArtifactStagingDirectory)/app.zip
        replaceExistingArchive: true
      displayName: Archive Files

    - publish: $(Build.ArtifactStagingDirectory)/app.zip
      artifact: drop

  - stage: Deploy
    displayName: Deploy Stage
    dependsOn: Build
    condition: succeeded()

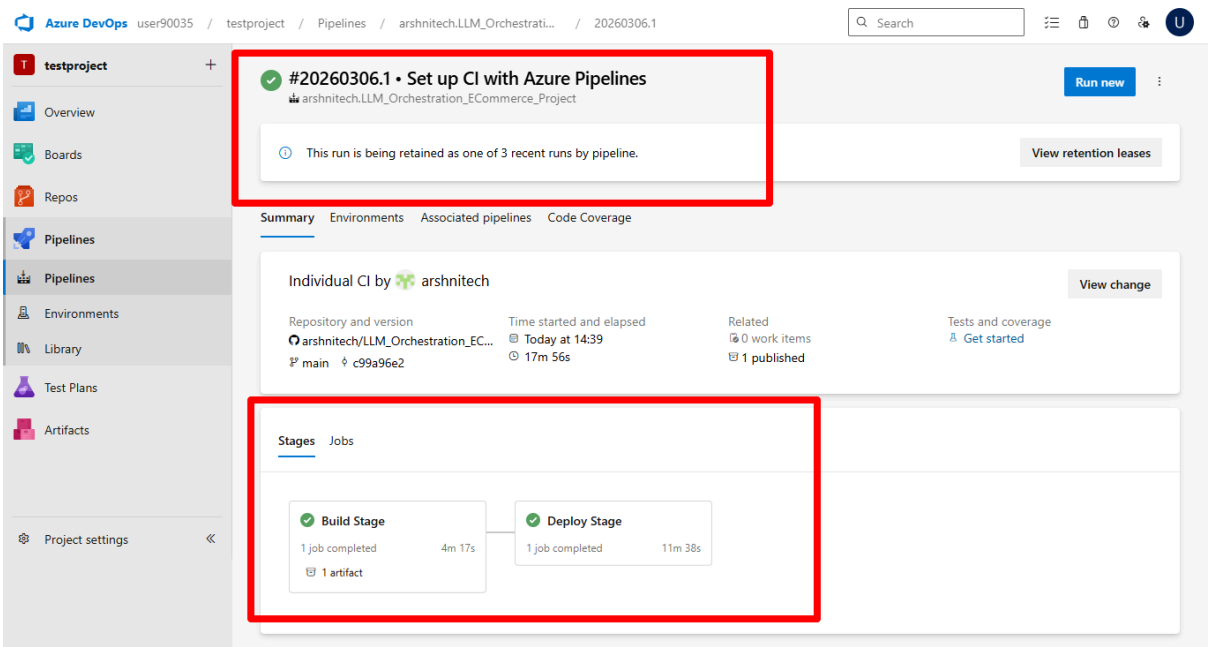
    jobs:
    - deployment: DeploymentJob
```

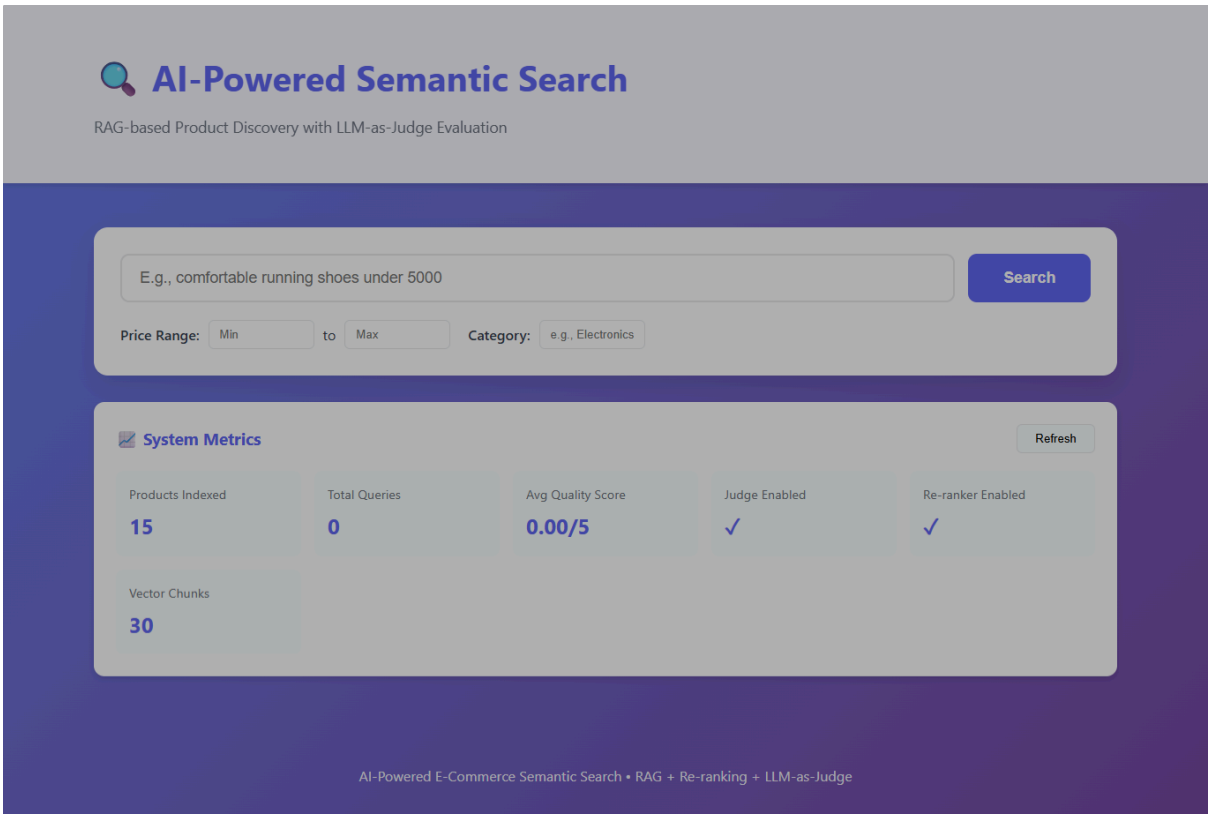
```
pool:
  name: selfhosted-pool   #  Self-hosted pool again

environment: E-commSemanticSearch

strategy:
  runOnce:
    deploy:
      steps:
      - task: AzureWebApp@1
        inputs:
          azureSubscription: $(azureServiceConnectionId)
          appType: webAppLinux
          appName: $(webAppName)
          package: $(Pipeline.Workspace)/drop/app.zip
```

after making above changes save and run





Once deployment is succeeded... it may take 15-20 minutes depending on the application
